This paper examines the nature of China’s current research climate and its effects on foreign scholarship. Drawing on an original survey of over 500 China scholars, we find that repressive research experiences are a rare but real phenomenon, and collectively present a barrier to the conduct of research in China. Roughly 9% of China scholars report having been “taken for tea” by authorities within the past ten years; 26% of scholars who conduct archival research report being denied access; and 5% of researchers report some difficulty obtaining a visa. The paper provides descriptive information on the nature of these experiences and their determinants. It concludes with a discussion of self-censorship and strategies for conducting research on China.

Keywords: China; Chinese Communist Party; repression; research; censorship

I. Introduction

Several recent incidents—from publishers’ decisions to censor articles on their Chinese websites to Cornell University’s suspension of collaborations with Renmin University—have raised concerns about a deteriorating climate for scholarly research in China, potential attempts by the Chinese Communist Party (CCP) to export censorship, and the potential for Chinese influence to corrode academic freedom in Western educational institutions.

Currently, however, there is no systematic data on how common it is for China scholars’ work to be affected by PRC repression, whether through publication censorship, visa denial, or another mechanism. Many are aware of several high-profile cases—the visa-blacklisting of scholars who helped publish *The Tiananmen Papers* or participated in an edited volume on Xinjiang—or know a colleague who encountered difficulty giving an invited talk or had passages excised from a Chinese-language version of their work. Methodological advice on fieldwork in China, similar to advice on research in other non-democratic contexts, often stresses data constraints, but does so without providing a systematic sense of how common or representative these constraints are. As a field, we simply lack good data on how (and how often) scholars’ work is affected by the non-democratic, sometimes repressive context of Chinese politics.

Data on this question can inform scholars’ work in two ways. First, researchers who understand the likelihood of encountering repression during their work can more accurately calibrate risk, protect interlocutors, and develop appropriate strategies to manage sensitive inquiries—a particularly important foundation for early-career researchers still learning to navigate research in China. Conversely, accurate data can prevent the field from exaggerating or misrepresenting risks, thereby triggering either unnecessary and problematic self-censorship or unfounded prejudice and backlash toward Chinese individuals.

A second way to view this data is as a case study of CCP attempts to manage its image, and information about its rule, at home and abroad. Previous studies of propaganda and censorship have examined how the CCP manages foreign presence, and how it seeks to control and shape narratives of its rule in domestic and global media. The data presented in this paper reveal, at minimum, that the Chinese political system constrains and molds knowledge production not just in media venues, but scholarly ones as well.

Below, we present findings from the China Scholar Research Experience Survey (CSRES), an original survey that offers the first systematic data on how often China scholars encounter repressive actions by the Chinese government, and catalogues the strategies that they employ in response to these challenges. Our core findings are as follows.

First, repressive experiences during research are a rare but real phenomenon, and collectively present a barrier to doing research in China. Roughly 9% of international scholars who conduct research in China report having been taken for tea by authorities in the past decade; 26% of scholars who conduct archival research report being denied access; 5% report difficulty obtaining a visa. Problems with access to China itself, access to subjects and materials, and surveillance and monitoring are common enough to be of concern.

Second, there are boundaries to the CCP’s use of repression against international researchers. Though temporary detention and questioning is common (9%), we found no evidence of scholars being physically harmed. Similarly, though ~5% of respondents report having difficulty with obtaining a visa at some point, a much smaller number report formal “blacklisting” or being banned from China for an extended period (12 of 562 respondents, 2.1%).

Third, different repressive experiences appear to have different logics. Access to China itself (visa issuance) does correlate somewhat with research topic, suggesting some broadly understood guidelines that produce relatively consistent (though far from uniform) decisions. Experiences inside China involving surveillance and potential intimidation, however, appear to emerge from localized strategies of risk management by lower-level officials—with the exception that scholars working in areas with heightened security (such as Xinjiang) appear systematically more likely to encounter authorities. Restrictions on access to materials appear to result from a combination of national trends (digitization as a method of archival sanitization, for example) and local variability.

Fourth, ambiguity plays a major role in shaping researchers’ perceptions and behavior. A majority of respondents (67%) believe their research to be sensitive, even though most reported no repressive experiences (57%) and had never received direct indication that their work was sensitive (68%). Moreover, it is more common for a colleague to be warned about the sensitivity of an international researcher’s work (12%) than for him/her to be warned directly (9%). Our data demonstrate that relational repression, control parables, and the use of uncertainty to shape political boundaries are not just tools used within China, but extend to China’s management of relations with the outside world.

Fifth, a majority of respondents (68%) identified self-censorship as a concern for the field, but provided several important correctives to accusations of careerism and cowardice. Respondents stressed the moral requirement to protect one’s interlocutors and subjects. Many also articulated a distinction between the ethical imperative to avoid self-censorship in the core tasks of academic work versus what they perceived to be a more discretionary choice about adopting publicly critical stances—especially on topics outside an individual’s research expertise. Respondents also noted that political pressure from China, while relevant, was not as influential as other

Stern and Hassid 2012; Stern and O’Brien 2012; Deng and O’Brien 2013.
disciplinary and institutional factors: an important piece of context in understanding the field’s scholarly output.

II. Research Design and Sample

We conducted an online survey of China-focused social scientists in spring/summer 2018. Our population of interest was international “social scientists who research China,” erring toward a broad definition of social scientist. By international, we mean scholars based at institutions outside of mainland China—which includes both foreigners and Chinese citizens. Through a combination of text scraping and manual research, we obtained names and email addresses of social scientists focused on China from the following sources: Association for Asian Studies members; scholars who presented on China at recent major disciplinary conferences; scholars published in China Quarterly in the past decade; China-focused PhD-level scholars at major think tanks; and a crowdsourced list of women China experts. To ensure that we had a sufficient number of respondents for valid inference, we limited the survey scope to scholars working in North America, Western Europe, Australia, New Zealand, and Hong Kong. Our sampling methods likely omitted some early-career scholars, and are English-language and Western- or North America-centric. We believe ours was a reasonable approach to generating a sampling frame but wish to transparently note these limitations.

After removing duplicates, invalid contacts, and “false positives,” we emailed 1967 individuals in May 2018 to invite participation and included a unique identifying link to the survey. We sent two follow-up emails and closed the survey in late June. We received 562 complete responses: an effective response rate of 28.6%, within the normal range for an online survey. Table 1 provides summary statistics for our sample:

Our sample contains a broad range of scholars who study contemporary China, including representation from different disciplines, research approaches, and topics. The response rate is relatively stable across personal attributes.

The CSRES survey itself had three blocks: questions on personal background (birth decade, discipline, rank, gender, etc); experiences with 13 different types of repressive experiences in the past ten years; and strategies to manage potentially sensitive research, including human subjects protection, institutional support, and self-censorship. The survey focused on research experiences, meaning that it did not ask about all potential forms of Chinese influence on academic institutions (such as campus speakers, institutional partnerships in China, or Confucius Institutes). The survey instrument contained a combination of structured questions and open-ended responses in order to enable systematic comparisons and an analysis of more nuanced patterns underneath the quantitative results. It was approved by Institutional Review Boards at both the

---

12 It should be noted that some potential respondents reported that our survey email had been blocked by their universities’ spam protocol, which may have depressed our response rate. This is an inherent limitation to online survey research.
University of Missouri and Princeton University.\textsuperscript{13} Further detail on our survey design choices and a complete copy of the survey instrument appear in the Supporting Information, which is available on the authors’ personal websites.

III. Results

Our analysis proceeds in three parts. First, we document scholars’ experiences with repression, and explore potential determinants of variation. We then describe scholars’ strategies for managing sensitive political issues, including self-censorship. We close by presenting collective “advice from the field.”

Repressive Experiences During Research

CSRES data suggests that repression during research is a rare but real phenomenon. Figure 1 shows the proportion of scholars who experienced different forms of repression during research in the previous ten years, grouped into the following categories: restrictions on access to China itself; restrictions on access to research materials or subjects; and surveillance and intimidation.

The most common experiences are to be denied access to particular materials in an archive or to be denied access to an archive altogether, followed by unexpected withdrawal of interview subjects and having Chinese colleagues contacted about one’s work.

Restrictions on Access to China. Denial of access to China itself—via visa denial or delay—is an often-discussed form of interference with scholars’ research conduct. It is also one of the most severe, with potentially career-altering impacts. Our data suggest two key findings: that the Chinese government does restrict visa access for work it considers potentially problematic, and that the most common form of restriction is temporary visa ‘difficulty,’ rather than outright denial or long-term blacklisting.

5.1\% of the CSRES sample reported a problem with obtaining a visa sometime in the past decade. Though it was not always clear that the scholar’s research had led to this difficulty, respondents often believed or received informal indication to that effect:

\textit{I was invited to a conference in XXXX and assured that... the authorities had approved my going there. However, in my visa app I foolishly said that after the conference I would go briefly to YYYY before returning home. This threw the consulate people into a tizzy. They phoned me, phoned my host, phoned my potential host in YYYY, trying to find out what exactly I would do there, and were never able to satisfy themselves sufficiently to issue the visa. I think they tried to get the Ministry of Foreign Affairs to approve it and didn't get an approval in time for the conference.}

\textsuperscript{13} The University of Missouri IRB approval number is 2011198. The approval number for Princeton University is 10683.
Multiple visa applications have been “delayed,” so I couldn’t take part in the official event I was invited to (I had an invitation letter from an official Chinese institution every time).

I had received a formal invitation from XXXX provisional government, but [my] visa was refused. There was no indication on my passport that the visa had been denied. I was verbally told at the embassy visa section that my application wasn’t approved.

Out of 562 survey respondents, six (1.2%) reported being denied a specific visa request within the last ten years. Often, however, the Chinese government did not issue a formal denial; the visa was simply never issued. (One respondent noted that this theoretically allows individuals to apply for future visas in the future without having to check “previous denial” on the application.) Thus, although we asked respondents to report visa “denials” versus “difficulty” separately, the practices of PRC embassies and consulates render the distinction blurry, and perhaps trivial.

12 individuals (2.1%) reported a belief that they had been blacklisted or banned from the mainland in the past ten years. They reported being involved in research on human rights, Tibet, Taiwan, elite politics, and the Mao period. About half were junior/tenured. Another 14 researchers answered “Maybe/Unsure”; their research topics were broader, but most touched on issues of ethnicity or foreign policy and security. We note here that long-term blacklisting may have cross-cutting effects: it can have severe consequences for a scholar’s career, but can also give a scholar the sense that they have “nothing to lose” by being openly critical, whereas more limited visa denial, by incentivizing scholars to remain cautious, may actually have a more constraining effect.

In short, the Chinese government does appear to strategically use visa issuance to manage researchers’ access to the country and set boundaries—formally and informally—for their conduct while they are there. A non-trivial percentage of scholars have experienced resistance trying to obtain visas for specific conferences or research trips, while never being formally denied permission to travel to China.

**Restrictions on Access to Research Materials and Subjects.** Constrained access to people/materials is fairly common. 21% of the CSRES sample reported being denied access to an archive or archival materials. Of those who use archival methods (77% of the CSRES sample), 26% had encountered such restrictions; in history, where archival access is central, the percentage is 41%. Moreover, many respondents who regularly conduct archival work reported that these incidents happened “too often to detail”; our survey documented over 150 separate instances in the past decade.

I was conducting research in XXXX’s municipal archive, and had requested to read back copies of the XXXX Ribao (nothing else). On the second day, I was asked to present additional paperwork (that I didn’t have); when I didn’t have it, the archivist went to the office, returned, and said that I needed to go downtown to the government building to speak to an official. He reviewed my papers, asked me some questions about my research topic and why I was there, and then told me that I could not go back to the archive.

The Head of the Reading Room at the XXXX also accused me of trying to steal their "national treasures" when I asked for some documents to be photocopied.
I was denied access to the XXXX ancient text office. The manager told me, "even if you knew the governor, I still wouldn't let you in."

Some researchers reported initially being granted access, only to have their entry revoked once their visit came to official attention.¹⁴

In instances where access was granted to an archive, but not particular materials, denials seemed based primarily on topic. A number of respondents documented being permitted access to one document, but denied for another.

Denied access to specific materials related to a certain ethnic minority group. Other materials in same provincial library were not a problem. Very selective denial of access.

XXXX documents that have not been scanned are now off limits—this is justified as protecting the documents, but in practice it functions to censor what kinds of materials scholars may use; it appears to be a nation-wide policy (not allowing scholars to see original documents from XXXX).

I was not granted access to the major portion of an archive at a prominent university research center. My Chinese colleagues informed me that the situation was too sensitive and they worried about how their own activities would be affected if I was granted access.

Although researchers discerned patterns related to the topics of materials requested, archivists rarely cited sensitivity in denying access, instead citing digitization or other internal processes.

Fairly typical response that material is not available. Often times, reasons are that material is being digitized, or "organized" in some way. In some instances, through back channels (usually by more junior personnel), I was made aware that the material was indeed available but not to foreign scholars.

Archive closed on short notice supposedly due to digitization. Contacts within China told me otherwise (clamping down).

The archival director said that the collection was undergoing digitization and informed his staff members to be careful about what they were sharing with me.

Access to particular materials also appears to have changed across time: respondents noted that digitization has resulted in sanitization or removal of previously accessible materials, and reduced availability of archival materials especially for foreign researchers.¹⁵

A district level archive—one in which I had worked in before and knew people—refused to let me view any materials, or even the index to supposedly open materials.

¹⁴ See also Kraus 2015a.
¹⁵ See also Kraus 2015b.
It has become incredibly difficult to conduct archival research in China. From 2012 to 2018, it has become increasingly difficult. I think it will soon be impossible... In China, I’ve had better luck at provincial archives and libraries. I’ve wasted a lot of time trying to get sources at large municipal or national archives.

Around two-thirds of the CSRES sample employed interviews or participant observation. 17% of these researchers have had interview subjects withdraw in an unexplained manner (most common in political science and anthropology).

One of my informants had arranged for me to interview their XXXX and friends. This was something that had been planned months earlier. When the time of the interview arrived, my informant backed out with a very odd excuse that didn’t seem true. Because I did not want to put my informant in danger, and I knew this was a possibility, I didn’t insist. I had several similar experiences from 2009 to 2012.

Researchers typically cannot discern with certainty if interviewees cancel because they have been “spooked” or discouraged by the authorities, or for another unrelated issue.

It is common for international researchers to have a Chinese colleague or friend contacted about their work: 12% of our overall sample, and 17% of those doing intensive fieldwork. Like the visa process, political sensitivity is conveyed via indirect channels and language, rather than directly through formal procedures; relationships rather than documents and institutions are used to communicate boundaries. We interpret this as a form of “relational repression” directed at foreign presence in China, and one that invokes ambiguity about boundaries as well as worry about colleagues and friends to induce caution and convince scholars not to push too hard on uncertain boundaries. This dynamic appears to create significant ripple effects on scholars’ risk management strategies (see below).

**Surveillance and Intimidation.** The Chinese government does monitor researchers, in ways they are often aware of; it does not routinely employ long-term detention or physical violence.

About 9% of China scholars (51 respondents) report being interviewed by the authorities (being “taken for tea”) in the past decade.

I had been interviewing participants in an ongoing protest in an out of the way industrial area and was waiting to try to talk to someone who was a target of the protest. An officer approached me while I waited. Then, he asked for my identity papers. He also asked to see my research notes and explain what they said. The policeman then took me to a nearby police station and he and his colleagues asked me questions for about an hour or an hour and a half.

Our research group, consisting of Chinese and foreign scholars, were conducting survey research in XXXX. Some elements of the research topic were considered politically sensitive. We were

---

16 Deng and O’Brien 2014.
contacted by the county government, spent a full day "having tea" and discussing the project, and finally asked to leave the county. We complied.

In conducting my fieldwork, I had to develop close ties to the local police. They had knowledge of my being there and so I had to meet with them regularly to "update" them. This took the form of brief meetings over lunch or tea about once every 3-4 months.

A day after being admitted to an archive, the Dean of my host institution invited me to a meeting at which we discussed my research in the presence of a middle-aged man whose job title was not disclosed to me, and the Dean indicated that access to that archive was "inconvenient" and would no longer be possible.

It was one of those regular interviews I had experienced in the past. Four gentlemen from the National Security Bureau visited me in one of the offices in a local university that was hosting me. The conversation was fairly friendly and the questions did not seem to have any particular focus. Some questions I recall were regarding (1) my circles of friends—such as their professional info and their respective research interests, (2) my religious activities, such as whether or not I had been to churches, and (3) my daily life. The conversation lasted about two hours and two of the people were taking notes with pen and recorders.

These experiences vary along several dimensions: intensity, duration, format/setting, perceived identity of interlocutors, etc. Scholars reported interviews or conversations with the local public security bureau, local officials, members of state-owned media, and individuals that did not formally identify their occupation. Conversations occurred in restaurants, hotel rooms, government or university offices, police stations, and by phone.

Despite this diversity, researchers reported some common elements. A scholar attracts attention during their research—attending a protest, requesting archival access, giving a talk, etc. Agents of the local government in turn respond, gather information, and often seek an end to, or place boundaries around, research activity. We note that the 9% of our sample who reported direct conversations with authorities is lower than the 12% who reported having friends/colleagues contacted; the two appear to be correlated ($r = .30$).

A smaller percentage of the CSRES sample (~2%) reported having their computer or materials confiscated. Others described having notes temporarily taken and reviewed by archivists, officials, or local police:

This happened at the Beijing airport custom. I flew back to Beijing from Hong Kong. My books and conference notes were searched, and a book on XXXX was confiscated.

While arranging to ship research materials back to the US, my materials were briefly confiscated, and I was taken to a side room and told that some of my materials were sensitive and could not be taken out of the country. After some back and forth, my materials were returned to me, and I shipped them another way.

The policeman took my notebook and read its contents (which were in English). They then returned it to me.
Archivists at the XXXX Archive in XXXX confiscated my notes temporarily (several days) to review them before allowing me to complete my research visit to the archive.

A small number (2.5%, 14 scholars) reported instances of temporary detention or physical intimidation.

On a short research trip to XXXX I was prevented from traveling to a research location. The police officer said "you have a visa problem." He said I had a business visa, when in fact I had a travel visa. He then took pictures of me with my passport and forced me to get into a taxi after taking pictures of me with the taxi driver and with the license plate of the car. During this process he ordered me to stand in particular locations and turn my back to him and the person he was speaking with.

I was visiting XXXX a town in west XXXX, open to foreigners and tourists. I was not conducting interviews but privately studying XXXX with a local. I was awakened one morning, placed in a van with two police officers, and driven to XXXX. I was not told the reason for my detention. The trip took two days, and we spent the night at a hotel. In XXXX, I was detained for four hours and interviewed by police. My camera was confiscated temporarily while the police reviewed the images. After four hours and much conversation with the police, I was released. I believe the police thought that I may have been a journalist.

I was detained for three days in a local hotel. A group of security staff (divided into two subgroups, one interviewing and one monitoring). The main focus was on my overseas study and my research. Being threatened to lose personal freedom and not able to leave and enter mainland China if I do not cooperate with them. I pretended to cooperate, and then reported to my University and the police when I came back XXXX. The thing seems to be temporarily solved, but I was suggested by the police not to go back China in recent years.

We draw three conclusions from the above. First, although we have redacted geographic information in order to protect respondent anonymity, these higher-impact events occurred disproportionately in places with heightened security presence, such as Tibet and Xinjiang.

Second, the 13 types of repressive experiences documented are not equivalent in their professional or personal impact on the scholars who experience them, or on the interlocutors that they might have worked with to conduct their research. Detention may be relatively unusual, but its impact is probably higher and longer-lasting than being prohibited from viewing a particular archival document.

Third, we do not find evidence that scholars who were detained were physically harmed, and CSRES documented temporary detention rather than long-term imprisonment. As of this writing (late 2018), our data did not show torture, forced confessions, overt threats to family members, exit bans, etc. being used against international scholars.
Determinants of Variation in Repressive Experience. What factors shape variations in the use of repression against international scholars in China? The data revealed several patterns.

First, repressive incidents are more common the more that the scholar works in China. For all categories except visa denial, the percentage of repressive experiences is higher among scholars who've conducted substantial fieldwork.\(^{17}\) (Visa denial makes sense: a scholar denied a visa cannot go to China, and therefore will not have these other experiences.)

Second, we do not find strong evidence that repressive experiences among international scholars have become more common under Xi Jinping (2012-present). We asked respondents to provide approximate dates for a subset of experiences, and show these in Figure 2:

[Figure 2]

Scholars' open-ended responses highlighted their overall perception that China’s research climate is becoming more constrained. Our survey data did not provide strong support for that claim: the only area to show a clear increase is denial of access to specific archival materials, where the average number of incidents since 2014 is notably higher than the average from 2008-2012.

We do not interpret our data as saying, however, that there has been no change to China's research environment. Most repressive experiences (visa denial, intimidation, etc) are rare enough that temporal trends should be interpreted with caution. Moreover, respondents have information to make their judgments that is not captured by the CSRES survey: pressure felt by Chinese colleagues; difficulty finding interviewees, or challenges of asking certain questions on surveys administered by Chinese firms.

Third, research topic plays some role in repressive experiences, though not a deterministic one. Figure 3 shows the most frequent research keywords used by scholars who'd been interviewed by the authorities or had visa issues of any kind.

[Figure 3]

Scholars with visa issues disproportionately study topics like ethnicity, minorities, religion, and human rights, but topics such as the environment, foreign relations, and gender appear also. The topics of scholars interviewed by authorities overlap. Words like “Xinjiang”, “Uyghur”, and “Muslim” also emerge more prominently, consistent with the finding that scholars working in that region are more likely to encounter the security apparatus.

In other words, researching certain topics can generate repressive experiences, but repressive incidents are not limited to scholars working on known “sensitive” topics—and conversely, plenty of scholars working on ethnicity, religion, and human rights have not experienced repression.

[Table 2]

\(^{17}\) We define “substantial fieldwork” as more than 12 months in mainland China in the past decade.
Similarly, repressive experiences were not strongly associated with demographic/professional attributes (Table 2). Generally, anthropologists and political scientists are more likely to have repressive experiences, while economists have relatively few. This may reflect disciplinary differences in both topics and fieldwork expectations—only 21% of economists in our sample had spent more than 12 months in the field within the past 10 years, compared with 38% of the full sample. PRC citizens are less likely to be denied archival access or be interviewed by the authorities, though they face slightly more pressure to cooperate with authorities. Academic rank does not play a major role; if anything, repressive experiences are slightly more prevalent among more junior researchers.

Perceptions and Indications of Sensitivity

CSRES data reveal that most China scholars are concerned about the sensitivity of their research. A majority of respondents believe their research is sensitive (“somewhat sensitive” 53%; “very sensitive” 14%). This percentage is highest among anthropologists and political scientists (Figure 4). Most scholars, however, have not received direct indication from the government that their research is sensitive, and nearly 60% have never had a repressive research experience.

[Figure 4]

This is not to say that China scholars are mistaken about sensitivity (though some may be). Rather, the observed patterns reflect the ambiguity discussed above, where researchers who are unclear on how their research is perceived must interpret and act on indirect signals that have potentially high stakes. Respondents recounted understanding sensitivity via the following kinds of interactions:

I've heard through the grapevine that my research is considered politically sensitive by Chinese officials.

I have heard from people not directly involved with my research that it may be politically sensitive, but have never had any immediate indications from research contacts or respondents that it is.

I have encountered resistance from archive officials at provincial-level and county-level archives, especially in XXXX China, when I visited their archives and attempted to use them for historical research related to nineteenth-century history. But it is always difficult to determine if their resistance is because: (a) they think my research topic is sensitive; (b) they know I’m a foreigner and therefore think that whatever research I do is sensitive; (c) my presence is merely an unexpected inconvenience which will require them to do more work; or (d) some combination of the above. I have never been told directly that my research topic is sensitive. However, I have been told that some portions of archival collections are simply off limits to me.

At the XXXX Municipal Archives, an archivist was assigned to vet every file I requested before I could see it. An undercover PSB officer was offered to me as a research assistant. Informants were questioned after speaking to me.
Between 20XX and 20YY, I was able to visit local field sites and interview officials and citizens and/or visit local archives through the normal routes (introduction letters from known scholars or institutions, connections through other officials, etc). After 20YY (or so), this became more difficult, and after 2012 nearly impossible. I say "maybe/unsure" because I have never been sanctioned by the Chinese government or officially prohibited from doing research, but local officials clearly signal that they are uncomfortable meeting me (or even having me visit their county or district) because of political sensitivity, even officials I have been in contact with for 10+ years.

Local interlocutors are most often responsible for signaling sensitivity; they almost always do so verbally and informally, rather than formally, in writing.

Often research is not blocked, but allowed to proceed while being monitored. This allows authorities to gather information on the researcher’s interests, activities, and intentions, while still ensuring that he/she does not cross certain boundaries. This often adds to perceptions of ambiguity, as noted below:

I have been pulled aside by various officials and told about the sensitive nature of the work, in part to explain why I could not read/access particular documents/people. But I have been able to do research, so clearly there are mixed opinions about the sensitive nature of the research among officials.

I think sometimes the image of censorship or repression looms larger than the reality, as I reflect on my own work. At the same time, authoritarian states are adept at creating fuzzy boundaries, precisely because they know that people will self-censor and stay far from what they may perceive to be a boundary, in order to avoid crossing it.

You never know where the border is; you only know when you have crossed it.

Even with CSRES’ systematic data, delineating what is “in bounds” and out is a highly probabilistic exercise. Ambiguity, indirection, and the use of Chinese interlocutors to communicate sensitivity benefits the Chinese party-state by raising the specter of consequences (to self and others) in the minds of international researchers.18

Research Strategies

A significant number of scholars deal with China’s repressive research climate by adapting their research conduct and presentation. Table 3 shows what percentage of the CSRES sample have adopted various strategies, by subgroup:

[Table 3]

18 Link 2002; Stern and Hassid 2012.
Scholars commonly use different language to describe projects in China (48.9%), as a way to investigate a topic without drawing unwanted attention. Other tactics include adapting a project’s focus away from the most sensitive aspects (23.7%) or even abandoning a project entirely (15.5%). Few people publish anonymously (1.6%).

We also asked respondents if they knew of others who adopted these strategies. These estimates were higher—though not 100%, and we note that multiple respondents may be thinking of the same colleague in answering “yes” to one of these questions.

Minor variations appear across subgroups. Economists are less likely to use these strategies; anthropologists and political scientists more likely. Again, this might be in part because of differences in fieldwork expectations across disciplines. Women and PRC citizens are slightly more likely to employ different language for projects or to adapt a project’s focus; junior scholars are somewhat more cautious than senior ones. Although the variations are minor, the data does suggest that vulnerability—whether regarding physical safety, personal or familial exposure to political consequences, or professional trajectory—makes adaptive strategies more likely.

Perceptions of Self-Censorship

The China field has recently interrogated its own levels of self-censorship. A majority of CSRES (70%) respondents agreed that, “self-censorship is a problem in the China field.” 22% were neutral and 7% disagreed.

A significant number of respondents, however, answered “I don’t self-censor.” Others mentioned that the relative freedom of foreign academics assigns them responsibility for speaking scholarly truth to official Chinese power, and exposing problems where others cannot; one wrote, “Keep speaking out. No one is better positioned to do so than researchers located outside of China.” Another respondent noted that blacklisting or repressive experience was treated as a “badge of honor” in certain scholarly communities, certifying one’s intellectual honesty. A large number of respondents treated resistance to self-censorship as a principled exercise in intellectual integrity, and a moral responsibility.

Several respondents noted that China’s repressive climate does not seem to have skewed research toward excessively positive interpretations of the CCP—in fact, perhaps the opposite. Sensitive topics attract scholars’ attention precisely because they suggest something important enough to warrant concealment, and researchers are often drawn to developing creative ways to address questions that remain unanswered. Our own discipline, political science, has no shortage of publications on sensitive topics in its top journals and presses.

The survey’s open-ended responses offered considerable clarification and complexity of thinking on the morality of self-censorship (Given the difficulty of fairly representing all views, we present

---

19 Carrico 2018.
20 One respondent noted that this discussion inevitably suffers from selection bias: “[J]udging by publications on contemporary China, I notice many pieces very critical of China on a wide variety of domestic and international issues. What I can’t know is how many pieces were never submitted for review.” Our data is not conclusive, but does suggest that there are projects that are not produced or submitted because of political constraints.
full comments in the Supporting Information). At a baseline level, scholars differentiated risks clearly, noting that threats of losing access were of greater professional consequence for junior scholars, and more importantly, that risks are higher for those living in mainland China, holding PRC citizenship, or with family inside China. One respondent stated plainly, “We all [self-censor]. We all must. If you’re like me, with family in China, there’s really no choice.” Again, open-ended qualitative evidence reinforces the survey’s quantitative finding that vulnerability correlates with the use of adaptive tactics.

Many respondents emphasized that decisions about how to frame research and what to say publicly were grounded in ethical considerations for others and a responsibility to protect their welfare and safety.

*Much of the self-censorship that goes on is done to protect colleagues and informants who live in China with little chance of leaving. If there is a conflict between never engaging in self-censorship and maintaining ethical research practices, I will choose to maintain ethical research practices.*

*For qualitative researchers working with living people, "self-censorship" might be another way of saying "protecting the people around you"--a core ethical research practice. "Self-censorship" could also be another way of saying "knowing when to keep your mouth shut."

*This is complicated, as everyone who works in China has to make some compromises. Different scholars will have different views on how far certain compromises are justifiable. Currently I am not trying to visit Xinjiang for field research as in my judgment it would be extremely difficult because of the security situation and could put informants at risk. Is this self-censorship?*

We believe that the effect of using interlocutors to communicate political boundaries appears particularly clearly here: it triggers researchers’ awareness of the ethical principles of field research and the legal requirements embodied in university IRB processes. It induces caution by giving international researchers the sense that the costs of boundary-transgression may be imposed on China-based interlocutors and colleagues.

Respondents also disaggregated levels and types of self-censorship, a term that the field has employed to reference a wide variety of different behaviors. First, many researchers acknowledged choosing words carefully while in China, but perceived a clear difference between exercising caution while operating as a researcher during fieldwork (acceptable and often ethical), and changing the conclusions of one’s intellectual work to avoid unpopularity with CCP authorities (unacceptable and unethical).

*Being careful with words and being respectful to the country and the people that you study is not self-censorship.*

*I am careful about what I present in China in public forums (such as a conference in China). But this does not constitute self-censorship, since this in no way affects the actual research and writing process of my work.*

Second, scholars distinguished between changing the conclusions of academic research, and choosing to adopt critical stances in public talks or op-eds. Is it self-censorship if a scholar decides not to adopt a publicly normative stance on issues they work on, or only if
an academic actually modifies their intellectual work out of fear of political consequences? At what point does discretion about public statements become problematic self-suppression or moral cowardice?

While there was universal objection to altering scholarly findings, the range of normative judgments on public commentary was broader; some believed that scholars refused to make publicly critical comments out of a fear of preserving access, while others noted that public commentary is discretionary, and so therefore a choice to engage in it or not was less problematic.

I think there are two different manifestations that often get blurred in the pundit world. One is whether a scholar, who decides for personal normative reasons to take a high profile position on China in social media or op-eds/commentary in the media or at think tanks, pulls punches either by avoiding a sensitive topic or toning down language. The other is whether a scholar who is publishing academic work in academic journals decides to avoid topics or modify findings or language in academic publications.

If there is self-censorship it is probably more likely to involve decisions about publishing high profile media op-eds, not scholarly work published in scholarly outlets. I personally think high profile op-eds are not our primary mission as scholars. So for the academy the more important question is whether there is self-censorship of scholarship. And here, as I said, I am not aware of any data showing this is a major problem.

Disciplinary and Institutional Factors

CSRES also asked how repressive pressure from China compared to other factors, including those affiliated with discipline, department, or institution. In general, respondents ranked pressure from China below both disciplinary and funding pressures. When asked to rate the “effect on research and publications,” only 20% said “political pressure from China” was very important, compared to 41% for disciplinary pressures (tenure/promotion), and 35% for funding.

These responses also highlighted the potential for censorship to come from third-party sources rather than from researchers themselves. With respect to funding, 8% of respondents believed that political concerns had affected a funding decision, usually from an external granting agencies (91%) rather than a university (9%).

Publishers also play an important third-party role. 18% of respondents had had a publication censored in China; 36% of these did not receive advance notification.

Finally, the majority of scholars navigate work in China without much support from home institutions. In response to an open-ended question about what, if any, institutional support scholars had received in dealing with the Chinese government, the most common response was “None.” Many had never sought assistance; of those who had, it was most commonly a university letter to accompany visa applications. Several respondents noted that they would more likely turn to colleagues than administrators if a problem arose, or mentioned cases where the university had come to them for guidance or help resolving a problem in China. Several volunteered a belief that their university was not equipped to handle these challenges.
 Advice from the Field

An open-ended question on advice for others generated both philosophical and practical responses. The most prominent theme emphasized listening to Chinese colleagues. Practically, respondents noted, those who live and work in China maintain better understanding of where boundaries lay, and how to navigate potential sensitivities.

*Close cooperation with Chinese scholars, speak Chinese well, have a solid and legitimate research project, know what you are doing, have a good sense of humor.*

*Be open with Chinese colleagues and ask for their advice. Most of them find these problems as frustrating as you do, but they are better at navigating these obstacles.*

*Especially for foreign researchers, be forthright about your research, your affiliations, and your motivations, but also frame your work in a way that echoes current Chinese academic discourse. Find the right host institution, and develop long-term relationships with Chinese collaborators.*

Respondents also emphasized ethical reasons to respect Chinese colleagues’ understanding: they will be disproportionately impacted by interacting with an international researcher who “gets it wrong.”

*I am clear with my Chinese interlocutors what my research questions are, what my hypotheses are, and what my specific questions for them are. This allows them to judge whether interacting with me is a problem for them.*

*Be honest about what you are studying in general terms, but do not force contacts in China into a situation where they have to take political responsibility for your research. If someone finds it inconvenient to meet with you, do not pressure them to meet with you.*

The necessity of protecting research subjects and interlocutors appeared repeatedly:\footnote{Carlson et al 2010.}

*N*your first responsibility is the safety, security, and well-being of your research collaborators or informants (NOT "subjects"). This is more important than your publication or your tenure or your degree. If you think in these terms and observe cues of whether people are comfortable or want to cooperate, you should be OK.

*You have a professional and moral obligation to protect your sources, even if the immediate costs to you are high.*

Many respondents offered advice that emphasized discretion and sensitivity to context. Variants of “keep a low profile” occurred frequently—not just to avoid short-term problems, but to develop the capacity to conduct long-term research and thereby create lasting intellectual value rather than emphasizing short-term, sensational results that might be extractive or harmful.
Be discreet. There is a(n American) tendency to make bold claims, especially among competitive PhD students. This is never a good idea for long-term field access and collaboration.

Just be sensible and forthright. Sensitive issues are not off the table if handled, well, sensitively. One does not have to upset others in order to demonstrate one’s competence as a scholar. Choosing language carefully is part of being an academic.

Truly think carefully about which aspects of your research are appropriate to share in which contexts. This doesn’t mean lying, but it does mean selecting the right emphasis for a particular audience. This includes publications. Don’t try to publish something in Chinese that might make trouble for your colleagues and collaborators. Save it for an English-language journal.

You can usually make more of a difference having a long-term career in the field doing good work over decades than having one sensational piece that might illuminate one thing, but silences you (and likely your interview subjects) for a long time afterwards.

Other respondents, however, expressed concern about the potential for “discretion” to justify self-censorship, and offered strong advice not to be overly cautious.

The first piece of practical-logistical advice centered on diversification of projects and source materials.

I recommend to my graduate students that they design research projects that do not depend on access to a single kind of source or archive, and ideally do not depend entirely on sources that are available only in the PRC—i.e. to spread their research around to include sources in Japan, Taiwan, Hong Kong, the US or Europe, etc., as much as possible. That way, if something in China is closed off, there will be other avenues of opportunity.

I urge researchers to systematically go through available documentary sources before conducting interviews, which are increasingly difficult to arrange. If the interviewee sees that someone knows a topic well, she is more likely to go to the heart of the matter, making interviews more productive.

Be creative, be patient. Have multiple projects so that if something tricky happens to one of them, you can work on other till better times. One can also do very good work on China without having to go on the mainland.

Respondents also noted that digital tools provide opportunities for analysis that was previously infeasible given restrictions on traditional fieldwork:

Even though the political situation in China is getting more constrained, I think current methods are making scholars more adventurous, not less. In the old days when you needed interviews to gain information, a lot of topics were impossible. Now with web scraping, text analysis, etc. there are many topics that can be explored without needing any permission.

The final cluster of suggestions had to do with technological steps to secure data and protect contacts; respondents described multiple methods to ensure digital security. To avoid compromising techniques that protect people and data, we do not discuss specifics here.
Recommendations in this area are also evolving rapidly. We encourage scholars to speak to experienced colleagues and sophisticated IT staff about best practices whenever possible.

IV. Conclusion

This article sought to provide new data on the frequency with which China scholars experience state repression, and ways in which repressive experiences affect research practice and output. We find that repressive research experiences among China scholars are a rare but real phenomenon. The majority of scholars have had no direct repressive experiences, but 5% have experienced visa difficulty; one in ten have been invited for tea; and one in five have had difficulty accessing archival materials. The indirect effects of repressive phenomena affect a far broader community: most China scholars believe their research to be sensitive; a majority adapt their conduct to protect themselves and others; and most express concern about potential self-censorship.

Our findings have implications for disciplinary conversations about research in authoritarian and repressive contexts, in China and beyond. The risks of research in China are uncertain, individualized, and not easily discernible from public information. Decisions about whether to pursue potentially sensitive research projects are highly personal: scholars encounter real consequences for conducting certain research in China, risks that are higher for both Chinese researchers, and one’s China-based colleagues and interlocutors. A scholar’s precise combination of constraints are not readily apparent from a CV or website, and may not be obvious to disciplinary colleagues working outside the Chinese context. The field should be careful about making blanket judgments on risk acceptance and avoidance, and China scholars will likely need to carefully communicate these tradeoffs to non-China-focused colleagues in their disciplines. We hope the CSRES data is helpful in that regard.

Our results also suggest several productive avenues for further research. One is to understand what goes on ‘inside the black box’ to unpack the roles of China’s various “authorities” when it comes to repression aimed at international scholars. Our finding that different repressive experiences follow different logics raises obvious questions: which authorities make these decisions, at what level, and with what reasons? Why, for example, is one scholar cautioned by a fellow academic, while another, studying similar questions in a different location, is invited to meet the local public security bureau? Should scholars view these incidents as the result of a coordinated effort to manage foreign scholars and foreign perceptions of China, or as the output of a patchwork of local actors operating in a fragmented authoritarian context?

We also see potential for replication and expansion of the survey in at least three directions. First, to understand whether the CCP’s management of Western scholars is distinctive, it would be useful to replicate the CSRES survey with a sample of international scholars based in Asia, Africa, and Latin America. Second, it would be useful to compare whether our findings on China are generalizable to other authoritarian contexts; we observe some parallels, but a valid comparison would, we believe, require more systematic data on researchers’ experiences in other authoritarian contexts.  

---

22 See note 6.
Third, our findings suggest that the production of knowledge on China is affected not only by individual research experience, but by the broader institutional and disciplinary context in which researchers work. CSRES data should, therefore, be complemented by data on aspects of China’s engagement with Western academic institutions beyond individual research projects: student organizations, campus programs, exchange programs, development relationships, and other institutional affiliations and partnerships. National organizations and Congressional hearings have documented incidents that are troublesome for academic freedom and sounded warnings about problematic practices, but this data is incomplete at best.\textsuperscript{23} There is a clear need for systematic research on the role of third parties–academic institutions, publishers, disciplinary associations, and the like–to more fully understand their experiences and responses.

By creating the CSRES data, we sought to address one major piece of this puzzle. The additional steps described above would, we believe, make a two-fold contribution: first, to improving the field’s theoretical understanding of what “Chinese influence” means and how it plays out globally, and second, to assist in crafting policy solutions that implement responsible academic engagement with China in a manner consistent with the values of freedom of thought and free exchange of ideas that characterize Western academic institutions. These are timely questions, and ones that will only grow in importance with China’s rise on the world stage.

Note: Table shows sample and population attributes for the China Scholar Research Experience Survey. Sampling frame only includes scholars based at institutions in the United States, Canada, Europe, Australia, New Zealand, and Hong Kong. Rank information not collected for sampling frame.
Figure 1: Experiences with Research Repression

Note: Figure shows total proportion of survey respondents that experienced different types of repression during the conduct of research in China within the last ten years. Data is from full sample of China Scholar Research Experience Survey (n=562). We identify researchers with “substantial fieldwork” as those that have spent more than 12 months in China within the past ten years. All visa statistics reflect only scholars that are not PRC citizens.
Figure 2: Documented Incidents of Research Repression Over Time

Note: Figure shows total documented incidents of six different forms of research repression over time. Data is from full sample of China Scholar Research Experience Survey (n=562).
Figure 3: Research Keywords for Respondents with Repressive Experiences

Note: Figure shows research keywords for researchers who reported having difficulty obtaining visas (visa denial, difficulties obtaining visa, blacklisted) (left panel) and who reported having been interviewed by the authorities ("taken for tea") right panel. The keyword frequency ratio is the proportion that keyword appears among the scholars reporting the incident divided by the proportion the keyword appears among the full sample. For example, a score of 2.5 means that the research keyword appears 2.5 times more frequently among the scholars reporting the incident versus all scholars surveyed. Keywords limited to those appearing with greater than a frequency of 3 in the full sample. Data is from full sample of China Scholar Research Experience Survey (n=562).
